ABSTRACT

semiconductor component includes bumped bumped contacts, a semiconductor die having die contacts, and a redistribution circuit having conductors for establishing electrical communication between the die contacts and the The redistribution circuit also includes bumped contacts. test contacts in electrical communication with the die contacts and with the bumped contacts. The test contacts allow the die to be tested without electrical engagement of the bumped contacts. The bumped semiconductor component can be contained on a wafer, or can be a singulated component such as a flip chip package. A test system includes the bumped semiconductor component, and an interconnect having contacts configured to electrically engage the test contacts without interference from the bumped contacts. If the test contacts are aligned with the die contacts, the interconnect can be used to test the bare die as well as the A test method includes the steps of: bumped component. providing the bumped component with test contacts; providing the interconnect with interconnect contacts configured to engage the test contacts without interference from the bumped contacts; and then testing the component by applying test signals through the interconnect contacts to the test contacts.
